

# Solar Thermal Technology in Australia - 2019

## Australian Energy Demand (Non-transport):

**Solar Thermal Collector Technology:** Flat plate collector with aluminum absorber, allowing hot water flow across the entire absorber surface area to achieve the World's most efficient solar collector.

■ Thermal Energy (heating & cooling)

■ Electricity Supply

Australian Energy Statistics

**Typical End Uses:** Space/greenhouse heating, domestic hot water supply, solar thermal cooling, district heating and industrial process heating.

**Industry Users:** Any low temperature (<95°C) energy intensive business such as horticulture, industrial processing & manufacturing, mining and real estate (commercial, retail, large scale residential).

**Life Cycle Cost Efficiency:** Maximum efficiency compared with gas, grid electricity and solar PV for all three usage patterns: Daytime-only use, nighttime-only use and mixed daytime and nighttime use.

**Payback Period:** Typically 5 – 7 years in Victoria (without any subsidies). Other states that are closer to the equator, receive 10% to 40% more solar irradiation and can pay back in less than 5 years.

**Performance:** 73% solar efficiency (Tier 1 Solar PV – 14% efficiency).

**Energy Generation Density:** 1,100 kWh/m<sup>2</sup> p.a. (Tier 1 Solar PV – 200 kWh/m<sup>2</sup> p.a.).

**Energy Storage Type:** Insulated stainless steel hot water storage tank (can be installed above or below ground).

**Energy Storage Cost:** From \$4.10 per kWh, with unlimited storage/discharge cycles, and no periodic replacement required.

**Longevity:** Collectors - 25 years @ 92% performance warranty. Storage Tank – lifetime.

**Cooling:** 7°C, via adding an absorption chiller (virtually no operating cost to run). As the ambient temperature rises, the solar thermal cooling efficiency increases (solar PV efficiency reduces with higher ambient temperatures).

**Project Scalability:** Unlimited maximum size, with multiple user distribution kilometers away from each other.

**Backup:** Any traditional heat source (e.g. gas boiler, electricity etc.).

**Off-Centre Solar Incidence Performance:** 98% @ +/- 50° from perpendicular.

**Operational CO<sup>2</sup> Emissions:** Nil.

**Electricity Grid Impact:** Nil

**Off-grid Compatible:** Yes. Electric demand is only to circulate water at 0.005 l/s per m<sup>2</sup> of collector.

**User and Installer Safety:** No risk of electrocution or fire.

**Recycling:** Fully recyclable, with no industrial waste or hazardous/toxic materials.
